

The Management of Nausea and Vomiting in the Last Few Days of Life

Supportive Information

- Alternative antiemetic: Stop haloperidol and prescribe levomepromazine 6.25mg by subcutaneous injection as required (or a subcutaneous infusion of 6.25 – 12.5mg levomepromazine via a syringe driver over 24 hours)

If symptoms persist for more than 24 hours or for further advice, contact Cynthia Spencer Hospice (01604) 678031 or Cransley Hospice (01536) 494605
